AMENDMENTS TO THE CLAIMS

- 1. (Previously Presented) A memory device for a mobile phone comprising:
- a flash memory for storing program data and user data;
- an interface circuit for copying program data stored in the flash memory according to whether data stored in the flash memory is valid;
- a first Random Access Memory (RAM) for providing an operation area to store and execute the copied program data; and
 - a second RAM for storing data generated during the execution of program data, wherein the first and second RAMs are independent memories.
- 2. (Original) A memory device as in claim 1, wherein the flash memory is a NAND-type flash memory.
 - 3. (Cancelled)
- 4. (Original) A memory device as claimed in claim 1, wherein the interface circuit is an application-specific integrated circuit (ASIC) including a read-only memory (ROM) for storing program codes and an error correction circuit.
- 5. (Original) A memory device as in claim 1, wherein the interface circuit comprises a first logic gate for generating a NAND CE (chip enable) signal, said NAND CE signal enabling the flash memory.
- 6. (Original) A memory device as in claim 5, wherein the interface circuit further comprises a second logic gate for generating a CLE (command latch enable) signal, said CLE signal informing the flash memory that incoming data is a command.
- 7. (Original) A memory device as in claim 6, wherein the interface circuit further comprises a third logic gate for generating a ALE (address latch enable) signal, said ALE signal informing the

flash memory that incoming data is an address.

- 8. (Original) A memory device as in claim 5, wherein the first logic gate is an OR gate for receiving a CS (chip select) signal from the microprocessor and a CE (chip enable) signal from the microprocessor for generating said NAND CE signal.
- 9. (Original) A memory device as in claim 6, wherein the second logic gate is an AND gate for receiving a command signal from the microprocessor and a CS (chip select) signal from the microprocessor for generating said CLE signal.
- 10. (Original) A memory device as in claim 7, wherein the third logic gate is an AND gate for receiving an address signal from the microprocessor and a CS (chip select) signal from the microprocessor for generating said ALE signal.
 - 11. (Previously Presented) A mobile communication device comprising:

an analog circuit for air interfacing the mobile communication device; a user interface circuit for interfacing between the mobile communication device and a user, wherein the interface circuit is an application-specific integrated circuit (ASIC) including a read-only memory (ROM) for storing program codes and an error correction circuit;

a microprocessor (MPU) for providing overall control of the operation of the mobile device; and

- a memory device including
- a flash memory for storing program data and user data;
- an interface circuit for interfacing the flash memory to the microprocessor;
- a first memory for copying the program data of the flash memory; and
- a second memory for executing the program data of the first memory,
- wherein the first and second memories are independent memories.
- 12. (Original) A mobile communication device as in claim 11, wherein the flash memory is a NAND-type flash memory.

13. (Original) A mobile communication device as in claim 11, wherein the first and second memories are random-access memories (RAM).

14. (Cancelled)

- 15. (Original) A mobile communication device as in claim 11, wherein the interface circuit comprises a first logic gate for generating a NAND CE (chip enable) signal, said NAND CE signal enabling the flash memory.
- 16. (Original) A mobile communication device as in claim 15, wherein the interface circuit further comprises a second logic gate for generating a CLE (command latch enable) signal, said CLE signal informing the flash memory that incoming data is a command.
- 17. (Original) A mobile communication device as in claim 16, wherein the interface circuit further comprises a third logic gate for generating a ALE (address latch enable) signal, said ALE signal informing the flash memory that incoming data is an address.
- 18. (Original) A mobile communication device as in claim 15, wherein the first logic gate is an OR gate for receiving a CS (chip select) signal from the microprocessor and a CE (chip enable) signal from the microprocessor for generating said NAND CE signal.
- 19. (Original) A mobile communication device as in claim 16, wherein the second logic gate is an AND gate for receiving a command signal from the microprocessor and a CS (chip select) signal from the microprocessor for generating said CLE signal.
- 20. (Original) A mobile communication device as in claim 17, wherein the third logic gate is an AND gate for receiving an address signal from the microprocessor and a CS (chip select) signal from the microprocessor for generating said ALE signal.
